RP10 Preparing Pure Organic Compounds – Knowledge Organiser

AQA A-level Chemistry • Set 1: Preparing a Pure Organic Solid **Paper 2**

#	Question	Answer
1	Method to purify a solid	Recrystallisation
2	Ideal recrystallisation solvent	Dissolves product when hot, not when cold
3	Why minimum hot solvent is used	Maximises yield on cooling
4	Why the hot solution is filtered	Removes insoluble impurities
5	Filtration of crystals	Büchner (vacuum) filtration
6	Why crystals are washed with cold solvent	Removes soluble impurities without dissolving product
7	Purity test for a solid	Melting point
8	Melting point of a pure solid	Sharp; matches data value
9	Melting point of an impure solid	Lower and over a range
10	Solid prepared in the AQA practical	Aspirin

RP10 Preparing Pure Organic Compounds – Knowledge Organiser

AQA A-level Chemistry • Set 2: Preparing a Pure Organic Liquid **Paper 2**

#	Question	Answer
1	Apparatus to separate immiscible liquids	Separating funnel
2	Reagent to remove acid impurities	$NaHCO_3(aq)$
3	Why the separating funnel is vented	CO_2 pressure builds up
4	How to identify the aqueous layer	Add water; see which layer increases
5	Layer drained through the tap	Lower, denser layer
6	Drying agent	Anhydrous $MgSO_4$ or $CaCl_2$
7	Sign that the liquid is dry	Clear, not cloudy
8	Final purification of a liquid	Distillation
9	Purity test for a liquid	Boiling point
10	Why anti-bumping granules are added	Smooth boiling
